## Description

GM3326 is step-up/down DC/DC converter controller ICs with fast, and low ON resistance drivers built-in. A versatile step-up/ down DC/DC converter can be realised by using with large output current only 4 basic external components - transistors, coils, diodes, and capacitors.

Output voltage is selectable in 0.1 V steps within a $2.4 \mathrm{~V} \sim$ 6.0 V ( $\pm 2.5 \%$ accuracy) range, and switching frequency is set at or 300 KHz .

GM3326 switches from PWM to PFM control during light loads, and the series offers high efficiencies from light loads through to large output currents.

Soft-start time is internally set to 10 msec , which offers protection against rush currents when the power is switched on and also against voltage overshoot.

During shutdown (CE pin = L), consumption current can be reduced to as little as $0.5 \mu \mathrm{~A}$ or less.

## Features

- Input Voltage Range : 2.0V ~ 10V
- Output Voltage Range : $2.4 \mathrm{~V} \sim 6.0 \mathrm{~V}( \pm 2.5 \%$ accuracy) (selectable in 0.1 V steps)
- Oscillation Frequency : 300KHz ( $\pm 15 \%$ accuracy)
$\bullet$ Output Current : more than $250 \mathrm{~mA}\left(\mathrm{~V}_{\mathrm{IN}}=2.4 \mathrm{~V}\right.$, $\mathrm{V}_{\text {OUT }}=3.3 \mathrm{~V}$ )
- Efficiency : 81\% (typ) at 5.0V, 78\% (typ) at 3.3V
- Stand-By : ISTB $=0.5 \mu \mathrm{~A}(\max )$
- Output Voltage Internal Set-Up
- SOT-25 Package

## Application

| Mobile phones | Portable audio equipment |
| :--- | :--- |
| PDAs | Various power supplies |
| Palmtop computers |  |

## TYPICAL APPLICATION CIRCUITS

GM3326
PWM, PWM/PFM SWITCHING STEP-UP \& DOWN DC/DC CONVERTER CONTROLLER ICS

## - BLOCK DIAGRAM

## Block Diagram Explanation

## <Error Amp.>

The error amplifier is used as an output voltage monitor. It compares the reference voltage with the feedback from the voltage divided by the internal resistor. Should a voltage higher than the reference voltage be fedback, the output of the error amp will increase.

## <PWM Comparator>

The PWM comparator compares the output of the error amp with the ramp wave. When the voltage at the output of the error amp is low, the EXT/ pin will be LOW level (Switching ON time).

## <Ramp Wave Generator>

The ramp wave generator, as the name suggests, generates the switching frequency's ramp wave.

## <PWM / PFM Controller>

With the GM3326 series, control is automatically switched between PWM and PFM according to the size of the load.
<Vref with Soft Start, CE>
The start up of the Vref voltage at the error amp's input is gradual due to the internal capacitor and low current circuit. Because of this soft-start function, the operations of the error amp's 2 inputs are balanced and the EXT/ pin's ON time can be manipulated to produce longer ON times.

Further, with the UVLO function, the signal will be such so as not to turn the MOS switch ON until any instability in the internal circuit stabilizes during soft-start time. Even in cases where input voltage is so low as to produce instability in the IC, the UVLO function will operate and the MOS switch will be turned OFF.

## [Step-up\&down DC/DC Converter]

Set output voltage obtained as a result of the automatic switching operations of the IC regardless of the difference between input voltage and set output voltage.

Figure 1. Input Voltage vs. Efficiency

The above graph shows that over a wide input voltage range, the efficiency of the GM3326 is more or less constant. In applications that use either a standard dry 3 cell battery or a cell lithium lon battery to obtain an output of 3.3 V , for example, the efficiency of GM3326 is again much better. Due to GM3326 does not have a series regulator output, we recommend a test with samples for use in applications where ripple voltage is a problem.

## External Components Selection (Notes)

The performance of the DC/DC converter IC circuit is heavily reliant upon the performance of the surrounding circuitry and components. In particular, since the $\mathrm{V}_{\mathrm{F}}$ voltage of the Schottky Diode used will have a direct effect upon efficiency, the smaller the diode, the better the efficiency obtainable. (Refer to the graph below)

It is also recommended that a switching MOSFET with a small ON resistance be used. With GM3326, an ON resistance of 500 m or less is recommended.

Figure 2. $\mathrm{V}_{\text {OUT }}=3.3 \mathrm{~V}$, $\mathrm{I}_{\mathrm{OUT}}=100 \mathrm{~mA}$

## - OPERATIONAL EXPLANATION

GM3326 is PWM (PWM/ PFM switching) step-up/down DC/DC converter controller ICs. Gm3326 switches to PFM operations during light loads and is very efficient over a wide range in relation to load. Further, the efficiency can be maintained over a wide input voltage range as both step-up \& step-down operations are PWM controlled. Output voltage settings are laser trimmed.

## [ON TIME]

P-Ch MOSFET $=\mathrm{ON}, \mathrm{N}-\mathrm{Ch}$ MOSFET $=\mathrm{ON}:$ Current flows from $\mathrm{V}_{\mathrm{IN}}$ via Pch MOSEFT, L, Nch FET to GND : L is charged.

## [OFF TIME]

P-Ch MOSFET (PSW) = OFF, N-Ch MOSFET (NSW) = OFF: Current flows from GND via Schottky 1, L, Schottky 2, to $\mathrm{V}_{\text {OUT }}: \mathrm{V}_{\text {OUT }}$ rises due to the charge stored at L . By comparing $\mathrm{V}_{\text {OUT }}$ with the internal reference voltage, the ON TIME vs OFF TIME ratio can be regulated \& output stability can be protected.

## - ELECTRICAL CHARACTERISTICS (GM3326-3.3V)

$\mathrm{V}_{\text {OUT }}=3.3 \mathrm{~V}, \mathrm{~F}_{\mathrm{OSC}}=300 \mathrm{kHz} \quad \mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$

| PARAMETER | SYMBOL | CONDITIONS | Min | Typ | Max | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
